1. Introduction

This document serves as a comprehensive reference guide for the Billboard Hot 100 Power BI Dashboard project. It covers everything from data extraction to publishing — designed to help anyone understand, replicate, or build upon this work.

Whether you are a data analyst, a music enthusiast, a business professional, or a student, this documentation will help you understand the story behind 68 years of music history and how data can reveal patterns that words alone cannot.

1.1 Project Overview

The Billboard Hot 100 Dashboard is an interactive, multi-page Power BI report that analyzes the complete history of the Billboard Hot 100 chart from its inception in 1958 through March 2026. The dashboard transforms raw chart data into meaningful visual stories about music trends, artist dominance, collaboration patterns, and cultural revivals.

1.2 Project Objectives

- Visualize 68 years of Billboard Hot 100 chart data in an interactive dashboard
- Identify patterns in music trends, collaborations, and chart longevity
- Understand the impact of the streaming era on chart behavior
- Discover which artists, songs, and eras defined American popular music
- Create a self-updating dashboard that refreshes weekly with new chart data
- Serve as a reference for future music data analysis projects

1.3 Who Should Read This

- Data analysts and Power BI practitioners looking for a real-world project reference
- Music industry professionals interested in historical chart data
- Students and researchers studying popular music and cultural trends
- Anyone curious about how 68 years of music history looks in data

2. What is Billboard? Why Does It Matter?

If you have never heard of Billboard, you are about to discover one of the most influential forces in the music industry — one that has shaped what we listen to, what gets played on the radio, and which artists become global superstars.

2.1 The Billboard Story

Billboard was founded in 1894, originally as a trade publication for the bill posting industry — think posters and outdoor advertising. Over time, it evolved to cover entertainment and eventually became the definitive authority on music popularity in America and around the world.

The Billboard Hot 100 — the chart at the heart of this project — was launched on August 4, 1958. The very first song to ever top the Hot 100 was 'Poor Little Fool' by Ricky Nelson. Since that day, the chart has been published every single week without interruption for nearly seven decades.

2.2 What is the Hot 100?

The Billboard Hot 100 is a weekly chart that ranks the 100 most popular songs in the United States. It is considered the definitive measure of a song's commercial success. A song's position on the chart is determined by a combination of three factors:

- Streaming activity — how many times a song is streamed on platforms like Spotify, Apple Music, and YouTube
- Radio airplay — how often a song is played on radio stations across the country
- Sales — digital and physical sales of the song

This combination makes the Hot 100 uniquely powerful. It is not just about who is buying music — it reflects who is listening, who is streaming, and what is being broadcast. A song that dominates all three categories can spend months at the top of the chart.

2.3 Why Billboard Matters

Billboard is not just a chart — it is a cultural barometer. Here is why it matters:

Cultural Influence

A song reaching #1 on the Billboard Hot 100 is one of the most significant achievements in music. It means millions of people across America are listening, streaming, and buying that song simultaneously. Artists, record labels, and radio stations all orient their strategies around the Hot 100.

Economic Significance

The music industry contributes over $170 billion annually to the US economy. The Hot 100 directly influences which songs generate the most revenue — a #1 hit can generate up to $1 million per week in streaming revenue alone.

Historical Record

The Hot 100 is essentially the diary of American popular culture. By reading the chart, you can trace the rise of rock and roll in the 1950s, disco in the 1970s, hip-hop in the 1990s, and the streaming revolution of the 2010s.

2.4 Billboard in the Streaming Era

One of the most fascinating aspects of this project is watching the Hot 100 transform after 2014, when Billboard began incorporating streaming data into chart calculations. This single change revolutionized what it means to have a hit song. Songs that previously would have faded from the chart after a few months could now stay on for over a year, sustained by millions of daily streams. Our data shows this dramatic shift clearly — average weeks on chart jumped from around 5 weeks before 2014 to over 15 weeks after.

3. The Data

3.1 Data Source

The data for this project was sourced from a publicly available GitHub repository maintained by developer mhollingshead. The repository collects and maintains the complete history of the Billboard Hot 100 chart in JSON format, updated every week when the new chart is released.

Data Source URL
https://raw.githubusercontent.com/mhollingshead/billboard-hot-100/main/all.json

This source was chosen because it is free, publicly accessible, regularly maintained, and covers the complete history of the chart from 1958 to the present day.

3.2 Data Structure

The dataset contains one row per song per week — meaning if a song spends 50 weeks on the chart, it has 50 rows in the dataset. Each row contains the following columns:

Column	Data Type	Description
Date	Date	The week the chart was published (weekly frequency)
Song	Text	The title of the song as it appears on the chart
Artist	Text	The artist name(s) including featured artists
This Week	Number	The song's position on the chart this week (1-100)
Last Week	Number	The song's position the previous week (0 if new entry)
Peak Position	Number	The highest chart position the song has ever reached
Weeks on Chart	Number	Total number of weeks the song has been on the chart

3.3 Data Scale

- Total rows: approximately 352,987 chart entries
- Unique songs: 32,415 distinct songs
- Unique artists: 11,195 distinct artists
- Date range: August 1958 to April 4th, 2026
- Update frequency: weekly (every Friday)

3.4 Data Limitations

While the dataset is comprehensive, there are a few limitations worth noting:

- Genre and country of origin are not included in the raw data — these would need to be added manually or via a secondary API
- Some song titles appear under multiple artists — for example, 'Hero' by Mariah Carey and 'Hero' by Enrique Iglesias are different songs. The data was addressed by creating a Song-Artist Key combining both fields
- The 'Last Week' field contains 0 for new entries rather than a blank value, which required special handling in calculations

4. Project Methodology — From Data to Dashboard

This section walks through every step taken to build the dashboard, from extracting the raw data to publishing the final report online.

4.1 Data Extraction

The data was extracted directly from the GitHub JSON URL using Power BI's built-in web connector, which means no manual downloading was required.

Steps:

1. Open Power BI Desktop
2. Home tab → Get Data → Web
3. Enter the URL:
   https://raw.githubusercontent.com/mhollingshead/billboard-hot-100/main/all.json
4. Power BI parses the JSON and loads it as a table
5. Click Transform Data to open Power Query Editor

4.2 Data Transformation (Power Query)

Before building any visuals, the raw data was cleaned and transformed in Power Query:

- Date column: set to Date data type
- This Week and Last Week: set to Whole Number
- Peak Position and Weeks on Chart: set to Whole Number
- Blanks in Last Week: replaced with 0 to indicate new chart entries

4.3 Calculated Columns (DAX)

The following calculated columns were added to enrich the dataset:

Column	Purpose
Position Change	Calculates how many positions a song moved (Last Week minus This Week)
Is Number One	Flags songs at position 1 (1 = yes, 0 = no)
Is New Entry	Flags songs entering the chart for the first time (Last Week = 0)

Trend Direction	Classifies movement as Rising, Falling, Stable, or New Entry
Decade	Groups years into decades (1950s, 1960s, etc.)
Year	Extracts the year from the date
Month Name	Extracts the month name for seasonal analysis
Month Number	Extracts month number for correct sorting
Is Collab	Detects collaboration songs by searching for Feat., &, x in artist name
Weeks Tier	Categorizes songs as Legend (40+), Hit (20-39), Charted (10-19), Flash (<10)
Collab Label	Human-readable version of Is Collab (Solo or Collab)
Song Artist Key	Combines song and artist to create unique identifier
First Chart Date	Finds the first date a song ever appeared on the chart
Is Revival	Flags songs that reappeared 10+ years after their first chart entry

4.4 DAX Measures

A dedicated _Measures table was created to store all DAX measures. Key measures include:

- Unique Songs — DISTINCTCOUNT of Song Artist Key
- Unique Artists — DISTINCTCOUNT of Artist
- Number One Hits — COUNT of rows where This Week = 1
- Avg Weeks on Chart — AVERAGEX over songs using MAX of weeks
- Longest Run Ever — MAX of Weeks on Chart
- Total Collabs — COUNT where Is Collab = 1
- Collab % — Total Collabs divided by Total Chart Entries
- Total New Entries — COUNT where Is New Entry = 1
- One Hit Wonders — COUNT of artists with exactly 1 distinct song
- Total Revivals — DISTINCTCOUNT of Song Artist Key where Is Revival = 1
- Revival % — Total Revivals divided by Unique Songs
- Weeks to Peak — Minimum weeks on chart when song was at its peak position
- Avg Weeks to Peak — AVERAGEX of Weeks to Peak across songs

5. Dashboard Design & Structure

5.1 Design Philosophy

The dashboard was designed to evoke the look and feel of an actual Billboard magazine — bold, editorial, and authoritative. The Magazine Editorial theme was chosen for its clean black-and-white palette accented with Billboard's signature red, giving the dashboard a professional and recognisable identity.

Theme Colors:

- Page Background: #FFFFFF (White)
- Header Banner: #111111 (Jet Black)
- Primary Accent: #C8102E (Billboard Red)
- Card Background: #F5F5F5 (Light Gray)
- Body Text: #222222 (Dark Gray)
- Muted Text: #666666 (Medium Gray)

Typography:

- Titles: Georgia Bold (serif — magazine editorial feel)
- KPI Numbers: Trebuchet MS Bold (condensed, impactful)
- Body & Labels: Segoe UI (clean, readable)

5.2 Dashboard Pages

The dashboard consists of 6 pages, each telling a different story about the data:

Page	Title	Purpose
Page 1	**Hall of Fame**	Overview of all-time records — longest running songs, most charted artists, headline KPIs
Page 2	**Decade by Decade**	How music changed across each decade — songs per decade, collab trends, new entries

Page 3	**Artist Deep Dive**	Search any artist to explore their full career timeline, peak positions, and best songs
Page 4	**Top Songs Explorer**	Browse top songs by year or decade with chart journey visualization and collab split
Page 5	**Trends & Insights**	Data-driven insights on streaming effect, collab explosion, seasonal patterns, and more
Page 6	**Revivals & Comebacks**	Songs that returned to the chart years later, one hit wonders, and Christmas classics

5.3 Navigation

A navigation bar was added to the header of every page, allowing users to click between pages without scrolling. The active page is highlighted in red, while inactive pages appear in gray. This was implemented using Power BI's built-in page navigation action on blank button visuals.

5.4 Live Data Indicators

Two measures were added to show data freshness on every page:

- Latest Data Date — shows the most recent chart date in the dataset
- Last Refreshed — shows the exact date and time the data was last pulled from the source

6. Key Insights & Findings

This section presents the most significant findings discovered through the analysis. These insights were derived directly from the data and are visible in the dashboard.

6.1 The Streaming Revolution

The single most dramatic finding in the entire dataset is the impact of streaming on chart longevity. When Billboard began incorporating streaming data into chart calculations in 2014, the average number of weeks a song spends on the chart changed dramatically.

> **Key Finding**
> Average weeks on chart jumped from approximately 5 weeks before 2014 to over 15 weeks after — a 3x increase driven entirely by streaming platforms keeping old songs alive.

This means a hit song in 2023 has three times more staying power than an equivalent hit in 2005. Songs like Blinding Lights (90 weeks), Heat Waves (91 weeks), and Lose Control (112 weeks) would have been impossible in the pre-streaming era. The longest-running song of the 1960s would barely make the top 20 longest-running songs today.

6.2 The Collaboration Explosion

One of the most visible trends in the data is the dramatic rise of collaboration songs — tracks featuring multiple artists. In the 1950s and 1960s, collaborations were rare. By the 2020s, they account for nearly one-third of all chart entries.

Insight	Finding
1950s	17.3% of chart songs were collaborations
1970s	Collaborations dropped to 11.5% — solo artists dominated
1980s	Lowest collab rate at 9.2% — the era of solo superstars
2000s	Collabs began rising to 23.5% as hip-hop features became mainstream
2010s	Collabs hit 34.7% — featuring another artist became standard practice
2020s	32.8% collaboration rate — the new normal in popular music

6.3 Artist Dominance

The data reveals a clear hierarchy of chart dominance across the decades:

- Taylor Swift leads all artists with 1,736 chart appearances — more than any other artist in history
- Morgan Wallen follows with 1,067 appearances, driven largely by his 2020s success
- Drake has 990 appearances, concentrated in the 2010s streaming era
- Elton John (889) and Madonna (857) represent the classic era — their appearances span four decades

What is particularly striking is that Taylor Swift's total appearances are nearly double those of Elton John, despite having a shorter career. This is entirely attributable to the streaming era — each of her albums generates hundreds of simultaneous chart entries as fans stream every track.

6.4 Seasonal Patterns

The monthly heatmap reveals clear seasonal patterns in chart behavior:

- December is historically the most active month for new #1 songs — driven almost entirely by Christmas songs returning to the chart every year
- April and May 2020s each recorded 8 new #1 songs — the highest of any month — suggesting that the streaming era has moved summer hit season earlier in the calendar
- Summer months (June-August) consistently show high chart activity across all decades

6.5 Christmas Songs — The Undying Revivals

Perhaps the most surprising finding in the entire dataset concerns Christmas songs. Three of the top 10 biggest comeback songs of all time are Christmas classics:

- Jingle Bell Rock by Bobby Helms (1958) — 68 total weeks on chart, returning every December for decades
- Rockin' Around the Christmas Tree by Brenda Lee (1960) — 71 total weeks, the longest-running Christmas song
- All I Want for Christmas Is You by Mariah Carey (2000) — 79 total weeks including multiple #1 runs

These songs were recorded in the 1950s and 1960s but continue to chart every single Christmas season. In the streaming era, they have become even more powerful — Mariah Carey's Christmas song regularly returns to #1 each December, a phenomenon that would have been unimaginable before streaming.

6.6 The One Hit Wonder Phenomenon

A total of 7,457 artists in the dataset had exactly one song ever reach the Hot 100 — representing approximately 66% of all artists who ever charted. This is a staggering statistic that reveals how difficult it is to sustain a career in popular music.

- The 2010s had the most one hit wonders with 1,775 artists — the streaming era created viral moments that launched artists onto the chart briefly before they faded
- The 2020s follow with 1,509 one hit wonders — suggesting this trend continues
- Interestingly, the 1950s had the fewest one hit wonders with only 263 — when radio was the only discovery mechanism, only established artists could break through

6.7 Speed to Peak Position

The data reveals how quickly songs reach their highest chart position across different decades:

- 1950s songs averaged 1.00 week to peak — songs either hit immediately or never did
- Modern songs (2010s and 2020s) average 1.09-1.16 weeks — taking slightly longer to build to their peak

This subtle difference reflects the streaming era's slow-burn phenomenon — songs now build gradually through algorithmic recommendations rather than hitting immediately through radio play.

7. Reading Between the Lines

Beyond the visible numbers, the data tells deeper stories about culture, technology, and human behavior. This section explores what the data reveals when you look beyond the obvious.

7.1 Music as a Mirror of Society

The Billboard Hot 100 is not just a music chart — it is a weekly snapshot of American culture. Each era's chart reflects the social, political, and technological context of its time.

- The 1960s chart explosion (6,200 unique songs — the most of any decade) reflects the cultural revolution of the era — more artists, more genres, more voices emerging as rock and roll democratized music production
- The 1980s chart contraction reflects the rise of the music video and MTV — fewer but bigger artists dominated, as visual appeal became as important as musical talent
- The 2010s streaming explosion reflects the democratization of music distribution — any artist could now release music globally without a record label

7.2 The Death of the Radio Hit

For most of the chart's history, radio airplay was the primary driver of chart success. A song needed radio stations to play it to reach listeners. The streaming era changed this completely.

Before 2014, new entries per year were declining — radio stations were playing fewer new songs, concentrating on established hits. After 2014, new entries surged dramatically. Streaming platforms have essentially become the new radio — but with no gatekeepers, anyone can break through.

7.3 The Feature Economy

The explosion of collaboration songs after 2000 reflects a fundamental shift in how the music industry generates hits. The 'featuring' culture — where a main artist invites another artist to appear on their track — became a commercial strategy, not just a creative choice.

A collaboration between two artists effectively doubles the potential audience. Each artist brings their fanbase to the song. In the streaming era, this strategy is even more powerful because algorithms recognize that fans of both artists are likely to stream the song, boosting its chart position.

7.4 Taylor Swift's Chart Dominance — What it Really Means

Taylor Swift's 1,736 chart appearances are not just a record — they represent a phenomenon unique to the streaming era. When she releases an album, all tracks appear simultaneously on the Hot 100 because her fanbase streams every song immediately. This would have been impossible in the radio era when only single releases could chart.

Her dominance reveals how streaming changed the fundamental concept of a 'hit' — in the old model, a hit was a single song that radio stations chose to play. In the streaming model, an album can generate dozens of simultaneous chart entries.

7.5 Revivals and Cultural Memory

The 78 revival songs identified in the dataset reveal something profound about how streaming has changed our relationship with old music. Songs from the 1950s, 1960s, and 1970s are being discovered by new audiences who were not alive when they were first released.

This is driven by several factors: films and TV shows using classic songs on their soundtracks (Bohemian Rhapsody returning to the chart after the 2018 Queen biopic), TikTok videos going viral with old songs (Running Up That Hill by Kate Bush returning in 2022 after appearing in Stranger Things), and streaming algorithms recommending classic songs to listeners.

8. Economic & Entertainment Industry Impact

8.1 The Economic Scale of the Music Industry

Understanding the Billboard Hot 100 requires understanding the economic scale of the industry it represents. The global recorded music market was worth $28.6 billion in 2023, with streaming accounting for 67% of total revenue. The United States alone contributes approximately $170 billion annually to the economy through music — supporting over 2.5 million jobs across production, distribution, live events, and licensing.

8.2 What a #1 Song Means Economically

Reaching #1 on the Billboard Hot 100 is not just a cultural achievement — it has significant economic consequences:

- A #1 song can generate up to $1 million per week in streaming revenue at peak
- Chart positions directly influence sync licensing fees — songs used in films, TV shows, and advertisements
- Radio airplay royalties are calculated based on chart position and play frequency
- Merchandise, touring, and brand deals all increase in value when an artist has a current #1

8.3 The Streaming Economy's Impact on Chart Behavior

The shift to streaming-based chart calculation has had profound economic consequences for the music industry:

- Long-tail revenue: Songs now generate revenue for years after release rather than weeks, changing how record labels value their catalogs
- Back catalog value: Classic songs by artists like Mariah Carey and Brenda Lee generate millions in streaming revenue every Christmas season
- Independent artists: Streaming has enabled independent artists to reach the chart without major label support, fundamentally changing the industry structure

8.4 Implications for the Entertainment Industry

The patterns revealed in this dashboard have direct implications for how the entertainment industry makes decisions:

- Film and TV studios use chart data to license songs that will resonate with target audiences
- Advertising agencies use artist chart performance to evaluate endorsement deal value
- Streaming platforms use historical chart data to build recommendation algorithms
- Record labels use decade-by-decade trends to identify which genres and styles to invest in

9. Technical Reference

9.1 Tools & Technologies

- Microsoft Power BI Desktop — dashboard development and data modeling
- Microsoft Power BI Service — publishing and scheduled refresh
- Power Query (M Language) — data transformation and cleaning
- DAX (Data Analysis Expressions) — calculated columns and measures
- JSON — source data format from GitHub

9.2 Complete DAX Measures Reference

All measures are stored in the _Measures table for organization:

Core Measures

- Total Chart Entries = COUNTROWS('Hot 100')
- Unique Songs = DISTINCTCOUNT('Hot 100'[Song Artist Key])
- Unique Artists = DISTINCTCOUNT('Hot 100'[data.artist])
- Number One Hits = CALCULATE(COUNTROWS('Hot 100'), 'Hot 100'[data.this_week] = 1)
- Unique Number One Songs = CALCULATE(DISTINCTCOUNT('Hot 100'[data.song]), 'Hot 100'[data.this_week] = 1)

Performance Measures

- Avg Weeks on Chart = AVERAGEX(SUMMARIZE('Hot 100', song, artist), CALCULATE(MAX(weeks)))
- Longest Run Ever = MAXX(SUMMARIZE('Hot 100', song, artist), CALCULATE(MAX(weeks)))
- Artist Best Peak = MIN('Hot 100'[data.peak_position])
- Artist Chart Appearances = COUNTROWS('Hot 100')
- Artist Total Weeks = SUMX(VALUES(song), CALCULATE(MAX(weeks)))

Collab Measures

- Total Collabs = CALCULATE(COUNTROWS('Hot 100'), 'Hot 100'[Is Collab] = 1)

- Collab % = DIVIDE([Total Collabs], [Total Chart Entries], 0) * 100

Revival Measures

- Total Revivals = CALCULATE(DISTINCTCOUNT('Hot 100'[Song Artist Key]), 'Hot 100'[Is Revival] = 1)
- Revival % = DIVIDE([Total Revivals], [Unique Songs], 0) * 100
- One Hit Wonders = COUNTROWS(FILTER(VALUES(artist), CALCULATE(DISTINCTCOUNT(song)) = 1))

9.3 Data Refresh Process

The dashboard is configured to refresh automatically every Wednesday at 12:00 PM Arabian Standard Time (UTC+4). This timing was chosen because the GitHub data source is updated every Wednesday after the new Billboard chart is released on Friday.

Manual Refresh Steps:

6. Open Power BI Desktop
7. Home tab → click Refresh
8. Wait for data to load from the GitHub URL
9. Verify the Latest Data Date card shows the most recent chart date
10. Save and republish to Power BI Service if needed

Scheduled Refresh Configuration:

- Platform: Power BI Service (app.powerbi.com)
- Frequency: Weekly
- Day: Wednesday
- Time: 12:00 PM
- Time Zone: Arabian Standard Time (UTC+4)
- Data Source Credentials: Anonymous (public GitHub URL)

10. Future Enhancements

10.1 Data Enrichment Plan

The most significant enhancement planned is enriching the dataset with additional attributes that are not available in the current source. This would involve manually researching and adding the following columns for the top songs:

- Genre — Pop, Hip-Hop, R&B, Country, Rock, Latin, etc.
- Sub-genre — Teen Pop, Trap, Classic Country, etc.
- Country of Origin — USA, UK, Canada, etc.
- Mood — Happy, Sad, Energetic, Romantic, etc.
- BPM (Beats Per Minute) — musical tempo
- Record Label — which label released the song

10.2 Planned Page 7 — Genre Insights

Once genre data is available, a seventh page will be added to the dashboard exploring:

- Which genres dominated each decade
- Genre diversity trends over time
- Which genres produce the longest-running songs
- Cross-genre collaboration patterns

10.3 Other Potential Enhancements

- Integration with Spotify API for audio features (danceability, energy, valence)
- Social media trend correlation — comparing chart positions with Twitter/TikTok activity
- International chart comparison — Hot 100 vs UK Charts vs Global Charts
- Predictive model — using first 2 weeks of chart data to predict peak position

11. Conclusion

The Billboard Hot 100 Dashboard represents more than a data visualization project — it is a 68-year journey through American popular culture, told through the language of data.

What began as a weekly list of popular songs has become, in the age of streaming, a real-time mirror of how millions of people around the world consume music. The patterns in the data tell us about technological change (the streaming revolution), social change (the rise of collaboration culture), and cultural continuity (Christmas songs that have been charting for 60 years).

The most important lesson from this project is that data without context is just numbers. The real value of this dashboard lies not in the charts themselves, but in the stories they tell — about artists who dominated their era, songs that refused to die, and a music industry that has reinvented itself multiple times in 68 years.

Final Thought

Every week, a new set of 100 songs enters this chart. Each one represents an artist's dream, a producer's craft, and millions of listeners choosing to spend a small part of their lives with that song. The Billboard Hot 100 is, at its heart, a record of what music meant to people — week by week, year by year, decade by decade.

Appendix — Quick Reference

A. Dashboard Pages Summary

Page	Title	Purpose
Page 1	**Hall of Fame**	32,415 songs, 11,195 artists, 1,162 #1 songs, 112 weeks longest run
Page 2	**Decade by Decade**	1960s had most songs (6.2K), 2010s highest collab rate (34.7%)
Page 3	**Artist Deep Dive**	Search any artist — career timeline, best songs, peak positions
Page 4	**Top Songs Explorer**	Filter by year/decade — top 10 songs with chart journeys
Page 5	**Trends & Insights**	Streaming effect, collab trends, seasonal patterns, heatmap
Page 6	**Revivals & Comebacks**	78 revival songs, 7,457 one hit wonders, Christmas song dominance

B. Top 10 Longest Running Songs

Insight	Finding
Lose Control	112 weeks — Missy Elliott Featuring Ciara & Fat Man Scoop
Heat Waves	91 weeks — Glass Animals
Blinding Lights	90 weeks — The Weeknd
Beautiful Things	89 weeks — Benson Boone
Radioactive	87 weeks — Imagine Dragons
All I Want For Christmas Is You	79 weeks — Mariah Carey
Sail	79 weeks — AWOLNATION
A Bar Song (Tipsy)	77 weeks — Shaboozey
Levitating	77 weeks — Dua Lipa
I'm Yours	76 weeks — Jason Mraz

C. Top Artists by Chart Appearances

Insight	Finding
Taylor Swift	1,736 appearances
Morgan Wallen	1,067 appearances
Drake	990 appearances
Elton John	889 appearances
Madonna	857 appearances
Kenny Chesney	783 appearances
Tim McGraw	749 appearances
Keith Urban	674 appearances
Stevie Wonder	659 appearances
Mariah Carey	657 appearances

D. Key Dates & Milestones

Insight	Finding
August 4, 1958	Billboard Hot 100 launched — first #1: Poor Little Fool by Ricky Nelson
2000	Collaboration songs begin rising significantly on the chart
2014	Streaming incorporated into chart calculation — changes everything
